C. WATER CONSERVATION

Our college has very good water management plan to support all our water needs including both ladies and gent's hostel. The water management is well supported with rain water harvesting and sump. The ground water is circulated to all overhead tanks using borewells.

The rainwater is harvested to charge the rainwater into the soil for ground water recharging. The storage of rainwater on surface is a traditional technique.

The borewells are constructed in water abundant points inside college. The ground water was pumped to sump using borewell. The sump and borewell are periodically monitored and maintained by plumbers and civil maintenance people to take immediate actions. The sump water is loaded to overhead tanks.

From the sump water is collected in overhead tank constructed at the top of each block. All blocks have overhead tanks to support water necessities. The water from overhead tank is separately treated by RO plant for drinking purpose. The drinking water is supplied in all blocks. A well-arranged pipe network connecting sumps and overhead tank to the water distributing point is established to support all water needs of the college.

Rainwater Harvesting

The institution has a rainwater harvesting system to ensure the supply of ground water. Rainwater harvesting is done at several points throughout the campus. The rainwater gathering pits were built according to industry standards. Rainfall is directed through wide shallow ditches that run the length of the campus, ensuring rainwater conservation. All open terraces are equipped with rainwater collection pipes that are routed to the ground via planned drains. Drainage from the entire building flows to the lower floor via an exterior drain.

Rainwater harvesting point.
