SYSTEMIC LITERATURE REVIEW

A systematic literature review is a research method that involves a comprehensive, systematic, and transparent approach to identifying, evaluating, and synthesizing the findings of all relevant studies on a particular research question or topic. It is a systematic process that aims to identify all relevant studies on a specific topic, evaluate their quality and relevance, and synthesize their findings in a clear and concise manner.

Systematic literature reviews differ from traditional literature reviews in that they are more structured and systematic in their approach. They involve a detailed and rigorous search for relevant studies, using a predetermined set of inclusion and exclusion criteria to ensure that only the most relevant and high-quality studies are included. The review process is also transparent, with clear documentation of the search process, inclusion and exclusion criteria, and methods of data synthesis.

There are several steps involved in conducting a systematic literature review, including:

1. Defining the research question or topic: The first step is to define the research question or topic that the review will focus on. This should be specific and clearly defined to ensure that the review is focused and relevant.
2. Searching for relevant studies: The next step is to conduct a comprehensive search for relevant studies. This typically involves searching multiple databases and other sources, such as conference proceedings and gray literature, using a set of predetermined search terms.
3. Evaluating the quality and relevance of the studies: The third step is to evaluate the quality and relevance of the studies identified in the search. This typically involves applying predetermined inclusion and exclusion criteria to determine which studies should be included in the review.
4. Synthesizing the findings: The final step is to synthesize the findings of the included studies, typically using a combination of qualitative and quantitative methods. This involves summarizing the main findings of the studies, identifying any patterns or trends, and drawing conclusions based on the evidence.
